Date of the first patient included per country	France: 09/10/2020 Spain: 25/11/2020 Portugal: 30/04/2021 Switzerland: 04/06/2021 Italy : 21/12/2021 United Kingdom : 22/06/2022	
Date of last patient included per country	France: 08/12/2022 Spain: 28/11/2022 Portugal: 06/12/2021 Switzerland: 26/07/2022 Italy : 26/11/2022 United Kingdom : 17/10/2022	
End of inclusion	December 9th 2022	
Total number of patients recruited	617	
Number of early terminations	20 early terminations: • 14 deaths • 1 consent withdrawal • 5 Lost of Follow up	
Expected date for study completion	April 2024	
Number of Serious Adverse Events (SAEs) and Unexpected Serious Adverse Device Effects (USADE) from all sites in reporting year	SAEs	*190*
	USADEs	0
Number of study endpoint-related adverse events from all sites	**65** • 14 Death • 26 suspected peri procedural MI (as declared by sites) • 4Myocardial Infarction • 20 Revascularization • 1 Stent thrombosis	
Summary of overall safety assessment	No specific actions taken for safety reasons in the reporting period.	
Conclusions	No new facts likely to alter the evaluation of the benefit-risk evaluation of the device and study were observed during the period under consideration. In view of available data, the risk-benefit ratio for this device and study remains unchanged.

2 Introduction

This is the 3rd Annual Safety Report (ASR) prepared by the CERC of the ongoing KISS study.

This ASR summarizes safety data arising from the KISS clinical study received by the CERC / CERIC between September 2022 and November 2023.

The Medtronic Resolute Onyx™ Zotarolimus-Eluting Coronary Stent System (Resolute Onyx™ system) consists of a balloon-expandable, intracoronary, drug-eluting stent (DES) premounted on a Rapid Exchange (RX) or an Over-the-Wire (OTW) stent delivery system. The Resolute Onyx™ stent is manufactured from a composite material of cobalt alloy and platinum-iridium alloy and is formed from a single wire bent into a continuous sinusoid pattern and then laser fused back onto itself. The drug coating of Resolute Onyx™ System consists of the drug Zotarolimus (the active ingredient) and BioLinx® polymer system (the inactive ingredient). The Resolute Onyx™ Zotarolimus-Eluting Coronary Stent System is indicated for improving coronary luminal diameters in patients, including those with diabetes mellitus, with symptomatic ischemic heart disease due to de novo lesions of length ≤ 35 mm in native coronary arteries with reference vessel diameters of 2.25 mm to 5.0 mm.

KISS study includes patients with coronary heart disease particularly patients with **de novo** coronary bifurcation lesion with >70% lesion in the main vessel requiring revascularization. The primary objective of KISS study is to evaluate the non-inferiority of no side branch (SB) intervention: test arm, versus side branch ballooning: control arm, in the setting of single stenting with systematic proximal optimization technique (POT), in the treatment of bifurcation lesion.

This is a randomized, prospective, post-market, multicenter study. Five hundred ninety-six (596) consecutive patients are planned to be enrolled in up to 20 participating investigational sites in up to 6 European countries. Subjects will be evaluated at 1 months and 1 year. Inclusion ended on December 9, 2022 and 617 patients were included.

3 Investigational device CE mark status

Medtronic Onyx stent has received CE mark in April 2014 and is used in this clinical trial according to its Instruction for Use.

DocuSign Envelope ID: BDE2059D-B72D-4AAE-BCEA-7D363CE5E7DF

4 Patient Inclusion Status

Site #	Country	Site name and address	Principal Investigator	Site Initiation date	First patient Included	Patient status	
						Enrolled patients	Early termination
250-01	France	Hôpital Privé Jacques Cartier ICPS 6, avenue du Noyer Lambert, 91300 Massy	Dr. Antoinette Neylon	28/09/2020	03/11/20	66	0
250-02	France	CHU Toulouse Rangueil Service de Cardiologie B 1, avenue du Pr Jean Poulhès 31959 Toulouse Cedex 9	Dr. Frédéric Bouisset	16/10/2020	23/10/2020	76	0

5 Changes to the Reference Document

Not applicable

6 Analysis of the patients' safety of the clinical study

1. Are there any new[1] and relevant findings related to the safety of the patients, including all new findings related to the safety of the medical device (s) or other treatments used in the trial and any other findings related to the clinical trial procedures? If yes, provide a concise description: Not applicable	Yes ☐ No ☒
2. Were there any safety-relevant measures taken by the sponsor, the investigators or imposed by Ethics Committees or Competent Authorities anywhere in the world ? If yes, provide details: Not applicable	Yes ☐ No ☒
3. Is there an update of the risk-benefit evaluation for the clinical study? If yes, provide details: Not applicable	Yes ☐ No ☒

7 Conclusion regarding the safety of study patients

No new facts likely to alter the evaluation of the benefit-risk evaluation of the device and study were observed during the period under consideration.

In view of available data, the risk-benefit ratio for this device and study remains unchanged.

[1] "New findings" refers to information not already present in the Investigator's Brochure or the Instruction For Use.

25008-0015-2	25008-0015	France	CHU Nîmes	24/12/2020	24/12/2020	Other:voluminous ematoma of the rectus muscle complicated by hemorrhagic shock:On return from coronary angiography, the patient developed a large right rectus hematoma complicated by hemorrhagic shock.An angioscanner was performed urgently and revealed a large right rectus hematoma measuring 110 mm by 76 mm, probably involving a branch of the inferior epigastric artery. A discrete leak of contrast medium at portal and late time without visualization at arterial time of passage within the hematoma. Also visualization of a false aneurysm of the puncture site opposite the femoral artery.A consultation with vascular surgeons indicated surgical management.The patient was operated on December 24 after hemodynamic stabilization and transfusion. A revision of a right femoral aneurysm and evacuation of a right rectus hematoma were performed. A scarpa approach and a rectus approach were performed. Closure with separate stitches of non-absorbable thread. 3 redons were placed. Vascularly, the redons were removed on December 28 and 30. The scars are clean with no discharge or hematoma. The stitches will be removed one out of two on 07/01/21 and the rest on 09/01/21.The stitches will be removed one out of two on 07/01/21 and the rest on 09/01/21.There was a significant inflammatory syndrome due to the	On going	Causal relationship	Not related	Yes

25008-0015-2	25008-0015	France	CHU Nîmes	24/12/2020	24/12/2020	Other:voluminous ematoma of the rectus muscle complicated by hemorrhagic shock:On return from coronary angiography, the patient developed a large right rectus hematoma complicated by hemorrhagic shock.An angioscanner was performed urgently and revealed a large right rectus hematoma measuring 110 mm by 76 mm, probably involving a branch of the inferior epigastric artery. A discrete leak of contrast medium at portal and late time without visualization at arterial time of passage within the hematoma. Also visualization of a false aneurysm of the puncture site opposite the femoral artery.A consultation with vascular surgeons indicated surgical management.The patient was operated on December 24 after hemodynamic stabilization and transfusion. A revision of a right femoral aneurysm and evacuation of a right rectus hematoma were performed. A scarpa approach and a rectus approach were performed. Closure with separate stitches of non-absorbable thread. 3 redons were placed. Vascularly, the redons were removed on December 28 and 30. The scars are clean with no discharge or hematoma. The stitches will be removed one out of two on 07/01/21 and the rest on 09/01/21.The stitches will be removed one out of two on 07/01/21 and the rest on 09/01/21.There was a significant inflammatory syndrome due to the	On going	Causal relationship	Not related	Yes

75601-0005-2	75601-0005	Switzerland	CHUV Centre Hospitalier Universitaire Vaudois	13/08/2021	23/12/2021	Other:Unstable angina:Patient was hospitalized (non-study center) on 23.12.2021 following sudden onset of oppressive chest pain at rest (intensity 3/10) that lasted 15 minutes, without irradiation and resolved spontaneously. Upon admission at the ER in non-study center, patient presented elevated troponin 42 ng/l without kinetic and a mild renal insufficiency (creatinin at 130 umol/l), which resolved spontaneously during his stay. Patient was transferred to study center on 27.12.2021 for an coronary angiogram. The angiogram showed tritruncular coronary disease with insignificant lesion of the middle anterior interventricular artery (small caliber artery, diffusely infiltrated). Significant stenosis of the 1st and 2nd diagonal, small caliber. Very tight stenosis of the entire CX, very diffusely infiltrated and of small caliber. Very good long-term post-PCI + 1x DES (Resolute Onyx 3.0 / 28) from 08.13.2021. In this context, a stress cardiac MRI will be organised in search of myocardiac ischemia and a medical appointment of one of the interventional cardiologist at study center.	Resolved	Not related	Not related	Yes
